

TACTICAL LINE

H-25 & H-27 MID RANGE TO LONG RANGE ILLUMINATED... OUR PREMIER RETICLES!

H-25

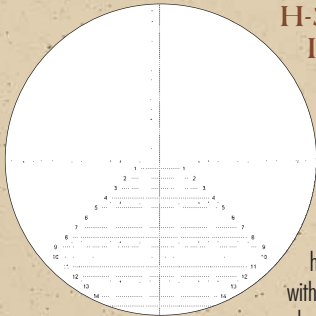

This is our recommended general all around reticle! The H-25 & H-27 Reticles are illuminated tactical reticles for low light, heavy growth, contrasting and standard conditions but are also an excellent choices for general hunting as well. The intensity of illumination is controlled by a rheostat so the rifleman's night vision is preserved and night vision devices may be attached to the scope to clearly see the reticle. For simplicity in ranging it has two rangefinders: the central crosshair is in Mil Radians (Metric) and the rangefinder in the lower left quadrant is in Inches of Angle (English) (On large International orders the latter feature may be eliminated) For point blank to approximately 1500 yards or meters. This is an excellent choice for .223 Rem. (5.56mm) or .308 Win. (7.62mm), however, this reticle also works equally well with all other cartridges including the .50 BMG and .338 Lapua. It does not require a sloped base.

H-27

H-31 MID-LONG RANGE-NON ILLUMINATED

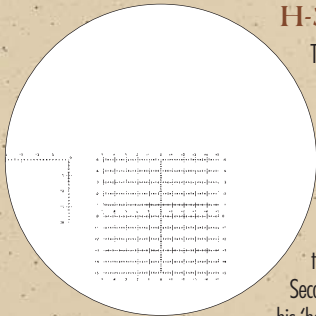

The H-31 Reticle is a highly calibrated tactical reticle designed for those familiar with mil dots and mil radian measurements. For quick, precise shooting at point blank to approximately 1200 meters. This reticle is a general purpose all Metric Reticle originally designed for military purposes but has equally as effective applications for hunting and target shooting. It is a medium width lined reticle with range finder located on the central duplex. It does not require a sloped base.

H-31

H-36

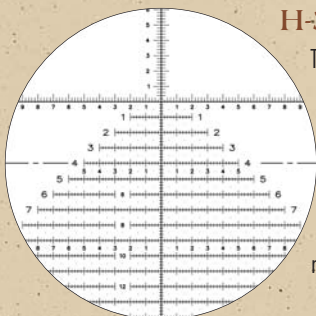

The H-36 Reticle is used exclusively in our Spotting Scope. The reticle is configured in a Mil Radian Matrix on the lower half of the viewable area. By locating the reticle in this fashion, the Spotter is able to view potential targets in the clear area of the scope. Once a target is located, the spotter places the target within the Grid for Ranging and shot placement purposes. Once a shot is fired on the target, the Spotter uses the Grid to call any windage or elevation adjustments for the Second Shot, should one be required. The Shooter will simply adjust his 'hold' up or down, left or right, by the number of Mil Radians or tenths of a Mil Radian that the Spotter calls out.

H-36

H-37 ULTRA LONG RANGE

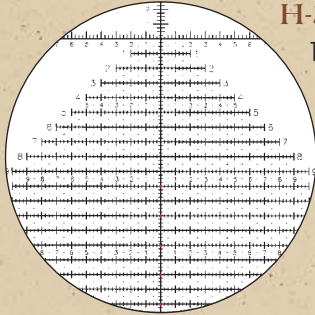

The H-37 Reticle is a standard lined ultra long range all metric reticle designed for use for targets at extremely long ranges. It is primarily designed for military purposes for cartridges such as the .338 Lapua, .300 Ultra, .50 BMG, etc. but has applications for long range hunting as well. It performs well in most light conditions. It is a medium width lined reticle with range finder located on the central duplex. It requires a sloped base.

H-37

H-38 SUPER LONG RANGE

The H-38 is only available in a 4-22X58 scope. It offers the same characteristics as the H-39 Reticle except it is designed for super extreme ranges out to 3000 meters. This is a special order reticle only and is intended only for the .338 Lapua and .50 BMG or other such super long range cartridges. It requires a sloped base.

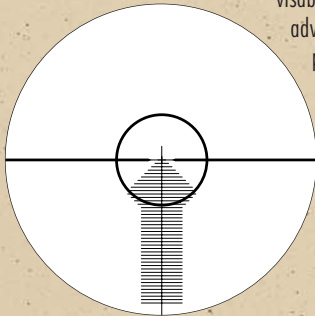

H-38

H-45 TACTILE FOR LOW POWER CQB AND MID TO LONG RANGE

The H-45 is a close to mid range (H-25) reticle that has a bold outer Ghost Ring. This Ghost Ring assures a repeatable cheek-weld while forcing the eye to center on the crosshair, ring and target combination. If full power range (4-16X) is required, this reticle is the best choice. At 14-16X, targets at 1000 to 1500 yards may be engaged. When quick shooting is required at close to medium ranges (50 to 300 yards), the 4 to 6X range is perfect since only the Ghost Ring and Side bars will be visible. This reticle is in the first focal plane and takes advantage of increasing and decreasing sizes when the power is changed. The H-45 is an excellent choice for 9mm, 45 ACP, .223 Rem (5.56mm) and .308 Win. (7.62mm) This Reticle doubles as an Assault and Sniper Reticle!

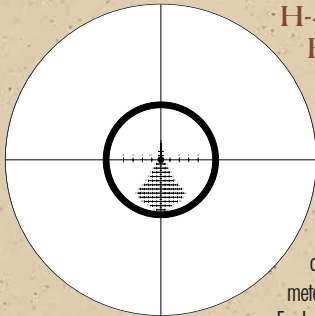

H-45 @ 16X

H-45 @ 4X

H-48 MID RANGE TO LONG RANGE ILLUMINATED

The H-48 Reticle is completely illuminated Close Range, Mid-Range and Long Range Reticle designed specifically for a low powered CQB optic. At Close range it presents a bold 'ghost ring' with a central dot in order to quickly engage targets with "Gross Accuracy". For Mid Range targets, with the optic set at 3X or 4X, the Bold Ghost Ring allows the rifleman's eye to be quickly centered naturally on the aiming dot. Shots from 1 meter to 200 meters simply require placing the target in the center of the Ghost Ring. For Long Range, the patented Horus Reticle Grid is used for precise hold over and windage adjustments for engaging targets beyond 200 meters.

H-48 @ 4X

H-47

The H-47 Reticle is a variation of the H-48 noted above but provides a finer center aiming dot which is the only part of the reticle that is illuminated. All other applications noted above in the H-48 are basically the same.

H-47 @ 4X
